

What is claimed is:

1. A cover, comprising:

a cover body being hard, being formed as a plate shape, comprising opposite surfaces and a socket protruding partially from one of the opposite surfaces, the socket having an inner peripheral surface;

a grommet held in the socket, being deformable elastically, and comprising a fitting hole and an outer peripheral surface, the fitting hole having an inner peripheral surface; and

a projection projecting from an installation member to which the cover is installed, and comprising a head, a neck having a diameter smaller than that of the head and an outer peripheral surface, the projection fitted into the fitting hole of the grommet, whereby holding the cover body detachably to the installation member,

the grommet further comprising a plurality of convexities disposed on at least one of the outer peripheral surface and the inner peripheral surface of the fitting hole, protruding in radial directions, and contacting with at least one of the inner peripheral surface of the socket and the outer peripheral surface of the projection.

2. The cover set forth in claim 1, wherein the grommet is held detachably in the socket; and the convexities are disposed on the outer peripheral surface of the grommet.

3. The cover set forth in claim 2, wherein the grommet is held

in the socket in such a manner that the convexities contact with the inner peripheral surface of the socket elastically.

4. The cover set forth in claim 1, wherein the convexities are formed as a substantially triangular cross-sectional shape whose thickness reduces from large to small in the direction away from the bottom to the top.

5. The cover set forth in claim 1, wherein the fitting hole is formed as a tapered shape whose inner peripheral surface has a diameter enlarging from small to large in the direction approaching the installation member.

6. The cover set forth in claim 2, wherein the projection has a superficial configuration comprising the head, the neck continuing from the head smoothly, and a bottom having a larger diameter than that of the neck; and the inner peripheral surface of the fitting hole of the grommet agrees with the superficial configuration of the projection and contacts with the projection entirely.

7. The cover set forth in claim 2, wherein the projection penetrates through the fitting hole, and comprises an outer peripheral surface whose diameter reduces from large to small in the direction away from the head to the neck at least and which contacts with the inner peripheral surface of the fitting hole.

8. The cover set forth in claim 1, wherein the grommet further comprises a regulator disposed at a portion facing the head of the

projection and extending radially inward to close the fitting hole,
the regulator provided with an air vent hole communicating the
fitting hole with the outside.
